

Q.1:- Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

ANSWER:-

Q.2:- Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases.

Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.).

ANSWER:-

FEATURE	HDD(Hard Disk Drive)	SSD(Solid State Drive)
Speed	Slower	Faster
Durability	It was moving part that's why less durability	It was not moving parts and shock resistant that's why much durable
Storage Technology	Using Magnetic disks	Use flash memory chips
Power Consume	More Power	Less Power
Best For	Storing large amount of data at a lower cost	Fast Operating System , gaming and everyday performance

Q.3:- Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

ANSWER:-

- **CPU (Central Processing Unit)**

The CPU is the main processor of the computer that handles game logic, player actions, and background tasks. In games like PUBG or Free Fire, it ensures the game runs smoothly by processing instructions quickly.

- **RAM (Random Access Memory)**

RAM temporarily stores the game data that the CPU needs while the game is running. More RAM helps the game load faster and allows smooth gameplay without lag when switching between tasks.

- **GPU (Graphics Processing Unit)**

The GPU is responsible for rendering the game's graphics, including characters, maps, lighting, and visual effects. A powerful GPU provides higher frame rates, better image quality, and a smoother gaming experience in games like **PUBG and **Free Fire**.**

Q.4:- Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

ANSWER:-

Hardware Component	Why Upgrade It?
CPU	A faster CPU improves game performance, reduces lag, and handles game calculations more efficiently.
GPU	A better GPU provides smoother gameplay, higher FPS (frames per second), and improved graphics quality.
RAM	Upgrading to 16 GB or more allows the game to run smoothly and improves multitasking.
SSD	An SSD reduces game loading times and makes the operating system and FIFA start much faster.
Power Supply	A higher-capacity PSU may be needed to safely power upgraded components like a new graphics card.
Cooling System	Better cooling keeps the CPU and GPU from overheating during long gaming sessions, maintaining stable performance.
