

Q1. On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details.

Q2.Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or BalenaEtcher to create a bootable USB drive for installation.

Hint: If you don't have a spare USB, use a virtual machine tool like VirtualBox to mount the ISO and start the installation process virtually.

Ans:-

* **Create a Bootable Linux USB**

Download an official Linux ISO and create a bootable USB drive using Rufus.

1. Download **Ubuntu 24.04 LTS 64-bit ISO** from the official **Ubuntu website**.
2. Insert an **8 GB or larger USB drive** into your Windows computer.
3. Download and open **Rufus**
4. In **Rufus**, select your USB under **Device**.
5. Click **SELECT** next to Boot selection and choose the downloaded Ubuntu .iso.
6. Leave the default settings and click **START**.
7. If prompted, choose **ISO Image mode**.
8. Confirm that you want to erase the USB.
9. Wait for Rufus to finish. When it shows **READY**, the bootable USB is complete.
10. Safely eject the USB.

* **If you don't have a USB**

Use **Virtual Box** instead:

1. Download the Ubuntu ISO.
2. Install Virtual Box
3. Create a new **Ubuntu (64-bit)** virtual machine.
4. Select the downloaded ISO as the installation media.
5. Start the virtual machine.
6. Ubuntu will boot from the ISO and you can begin the installation **inside the virtual machine without replacing Windows**.

Q3. On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati. Hint: Find 'Language & Region' in System Preferences to add or change languages.

Q4. Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.

Q5. Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing.

Ans:-

➤ Step-by-Step Guide: Installing Windows 10 on a Laptop

1. Prepare the laptop

- Back up important files to an external drive or cloud storage.
- Connect the laptop to AC power.
- Make sure you have a **Windows 10 installation USB** (at least 8 GB).
- Confirm that the laptop meets Windows 10 requirements.
- If possible, have your Wi-Fi password ready.

2. Boot from the Windows 10 USB

1. Insert the Windows 10 USB.
2. Restart the laptop.
3. Open the **Boot Menu** (commonly F12, F9, Esc, or another key depending on the manufacturer).
4. Select the USB drive.
5. Windows Setup will start.
6. Select **Language, Time and currency**, and **Keyboard** settings.
7. Click **Next** → **Install now**.

3. Product key and edition

- Enter your Windows product key if requested.
- If you have a digital license, select **I don't have a product key** and install the edition matching your existing license.
- Accept the license terms.

4. Choose installation type

Select:

Custom: Install Windows only (advanced)

This allows you to manage the disk partitions.

5. Partitioning tips

If this is a **completely fresh installation** and you have already backed up your data:

1. Identify the drive where Windows will be installed.
2. For a clean installation, delete the old partitions **only if you are certain they contain no files you need**.
3. Select the resulting **Unallocated Space**.
4. Click **New** if you want to create your own partitions.
5. Otherwise, select the unallocated space and click **next**.

Windows will automatically create the required system/recovery partitions.

Recommended simple setup:

- One Windows partition (C:) using most of the SSD.
- Keep some free space available for Windows updates and applications.

⚠ important: Do not delete recovery or data partitions blindly. If the laptop contains important files, stop and back them up first.

6. Install Windows

- Select the partition where Windows should be installed.
- Click **Next**.
- Windows will copy files and restart several times.
- **Do not press a key to boot from the USB again** after the restart.

7. Complete initial setup

After installation:

1. Select your region.
2. Select your keyboard layout.
3. Connect to Wi-Fi if required.
4. Create or sign in with a user account.
5. Create a strong password/PIN.
6. Review the privacy settings.

8. Privacy settings

During setup and afterward, review:

Settings → Privacy

Consider limiting permissions that you don't need, such as:

- Location
- Camera
- Microphone
- Contacts
- Account information
- Background apps

Also review **Settings → Privacy → Diagnostics & feedback** and choose the least data-sharing option available.

9. Install Windows Updates

Go to:

Settings → Update & Security → Windows Update

1. Click **Check for updates**.
2. Install available updates.
3. Restart the laptop.
4. Check again until no important updates remain.

Important: Windows 10 reached its official end of support on **October 14, 2025**. For a new installation in 2026, Windows 11 is generally the safer choice if your laptop supports it. If you specifically need Windows 10 for compatibility or an assignment, be aware of its support status.

10. Install drivers

Check **Device Manager** for devices with warning icons.

Install drivers from your laptop manufacturer's official support website, especially:

- Chipset
- Graphics
- Wi-Fi/Bluetooth
- Audio
- Touchpad
- Network
- BIOS/firmware, when appropriate

11. Final settings

- Activate Windows.
- Set the correct time zone.
- Install required applications.
- Enable Windows Security/Defender.
- Create a restore point if appropriate.
- Verify that Wi-Fi, sound, display, USB ports, Bluetooth, and touchpad work correctly.

Steps that may be unclear or missing when you actually follow the guide

- **Boot-menu key:** varies by laptop manufacturer, so the exact key must be checked for the specific model.
- **Partition sizes:** there is no single correct size; it depends on the SSD capacity and how much data you plan to store.
- **Product activation:** depends on whether the laptop has a digital license/product key.
- **Drivers:** Windows may install generic drivers, but manufacturer-specific drivers can still be needed.
- **Windows 10 updates:** the normal free-support period has ended, so current update/support options should be checked before relying on Windows 10.
